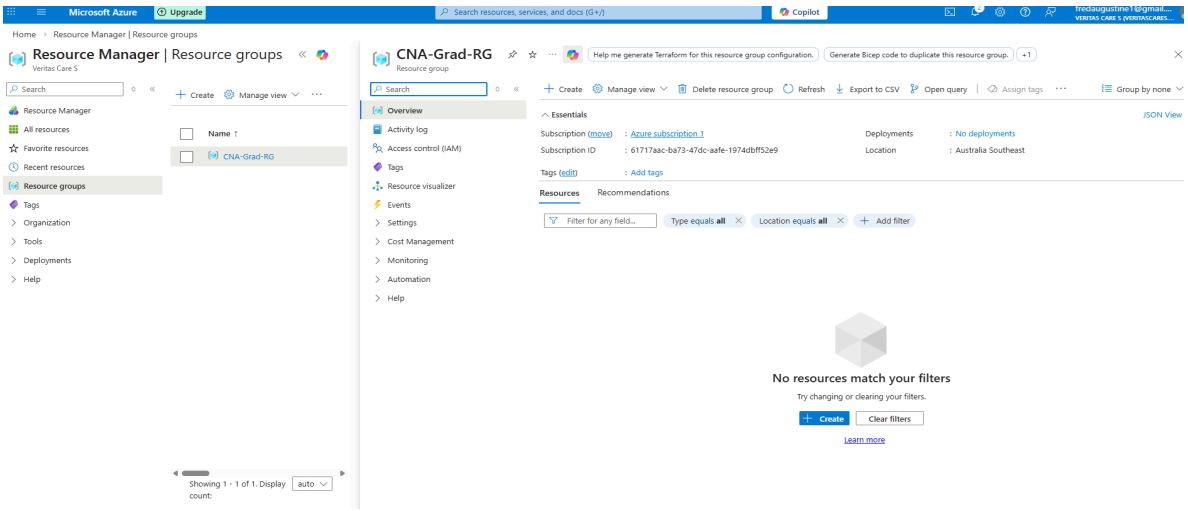
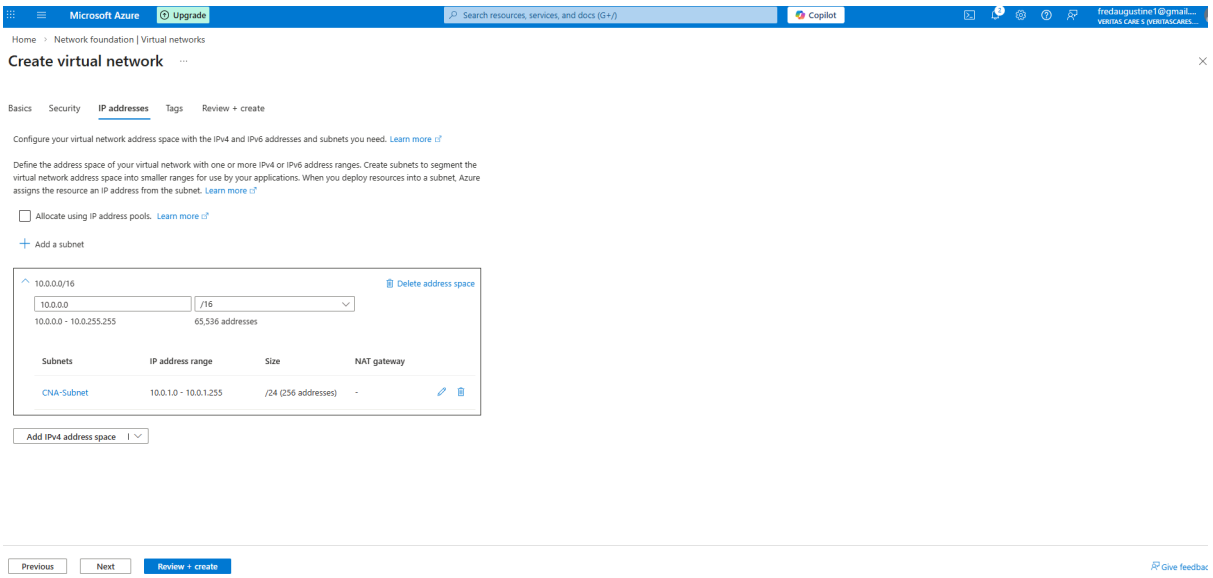
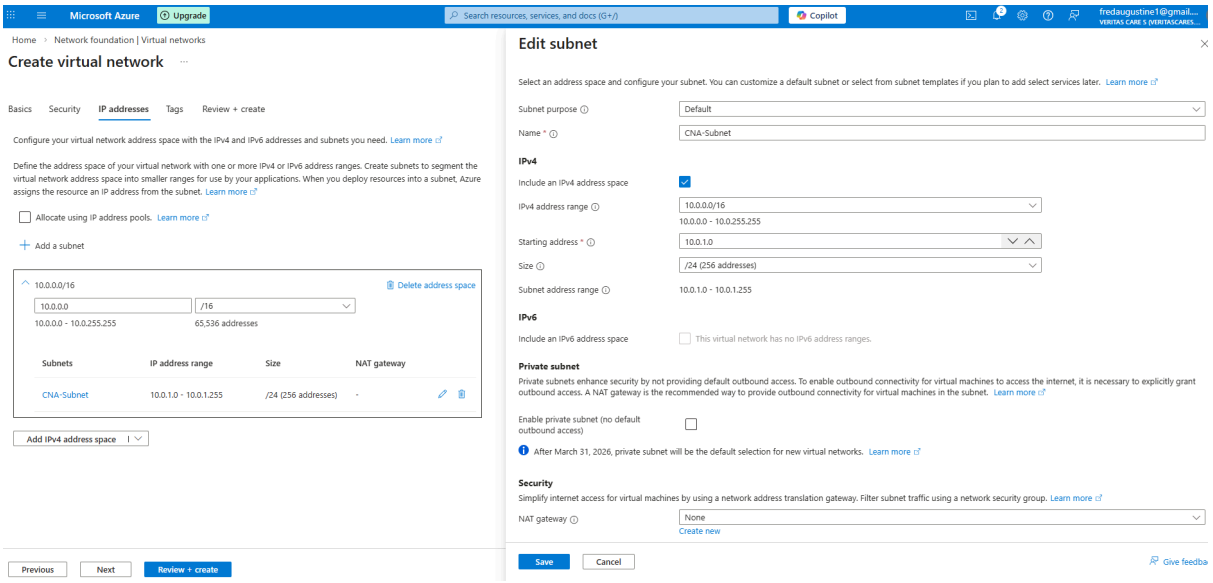
- Resource Group Overview page



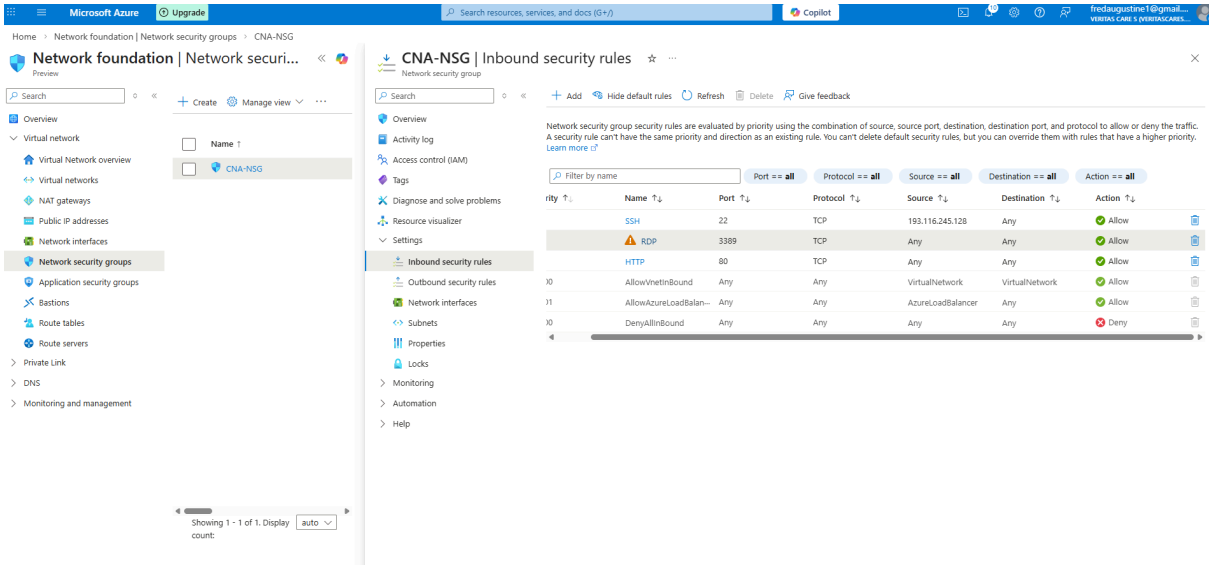
- VNet Address Space



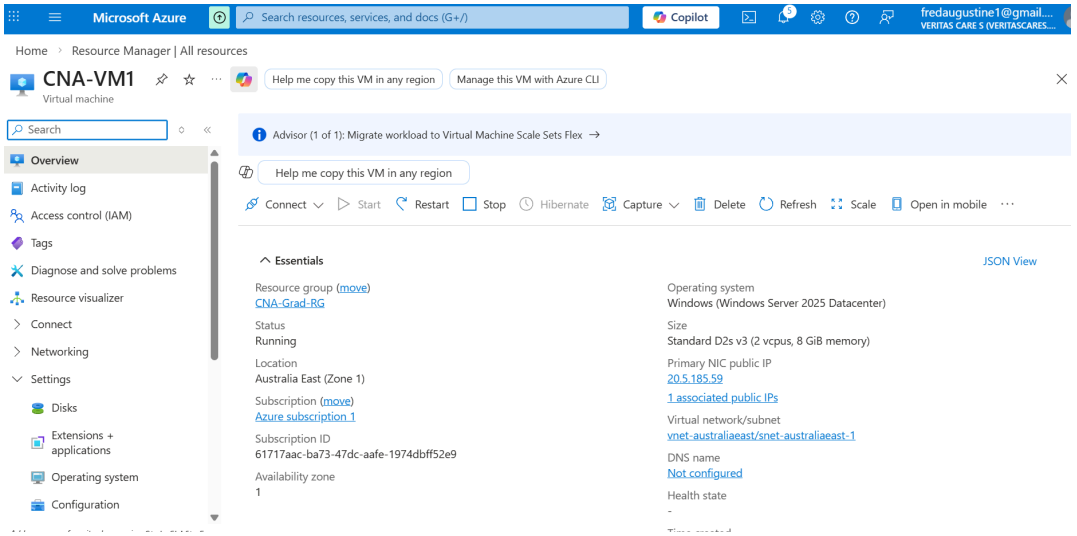
- Subnet configuration page



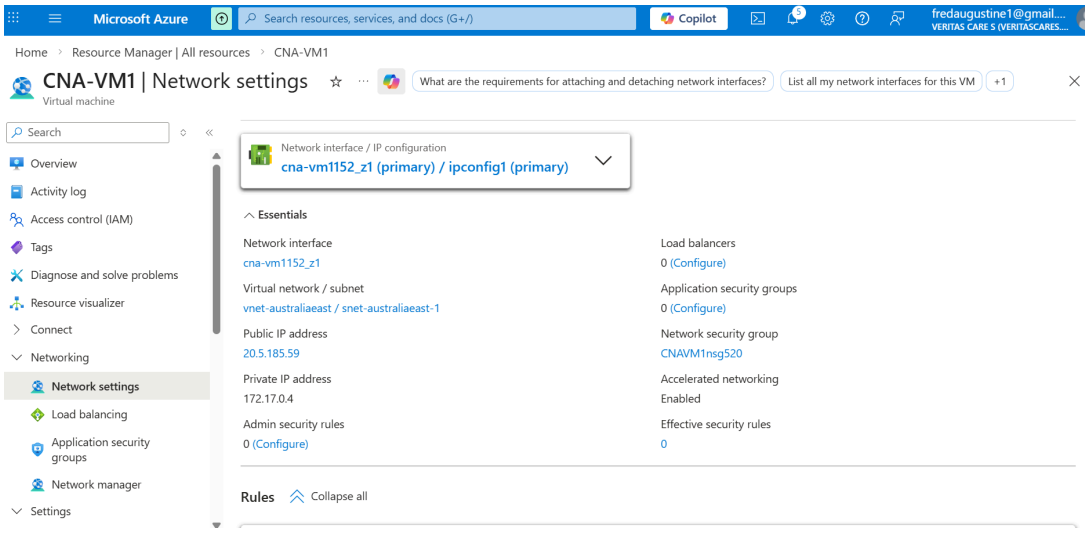
- NSG rule configuration page



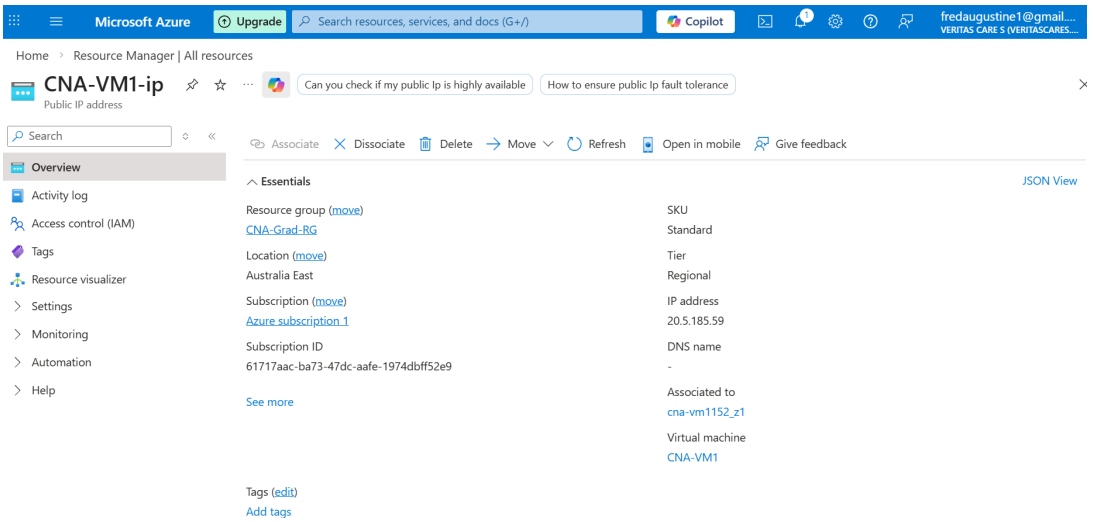
- VM overview page



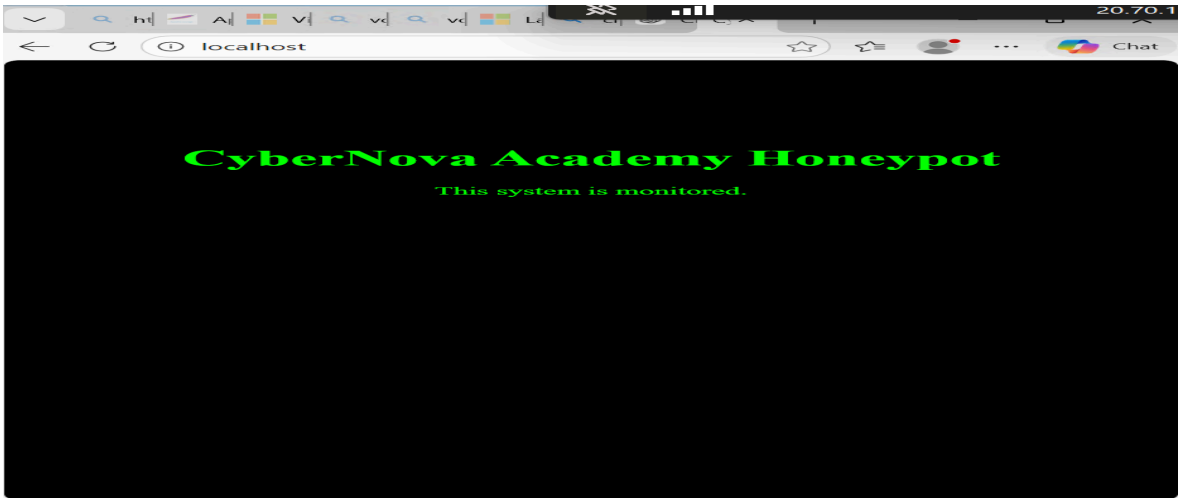
- Networking tab



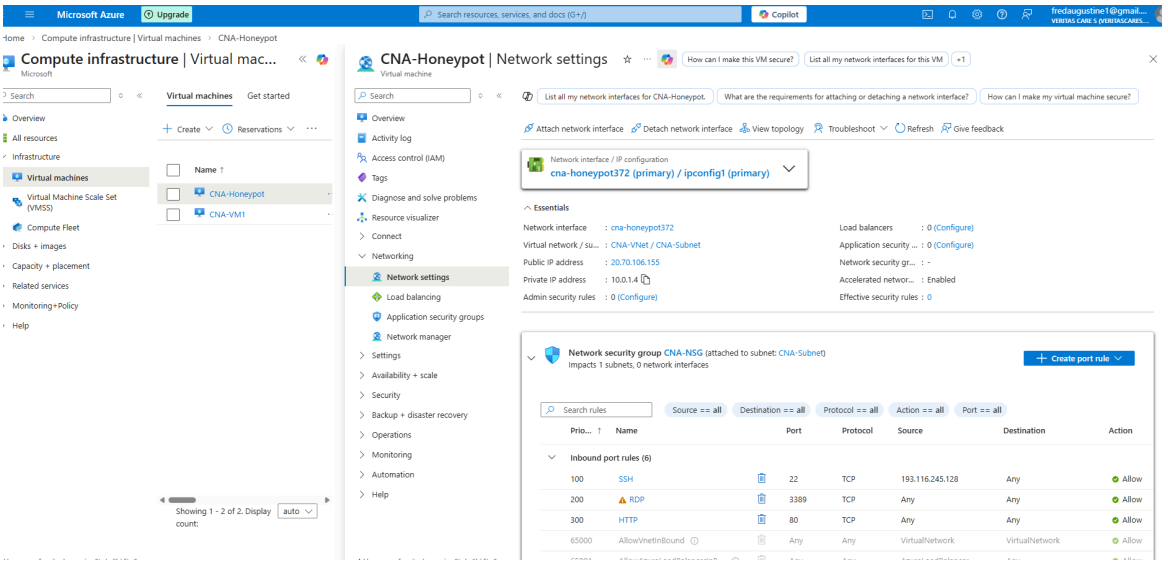
- Public IP details



- Web page accessed via browser



- NSG rules for honeypot



💡 Bonus (Optional +5 Marks):
Install logging agent (Azure Monitor Agent)

NOTE: azure monitor agent could not be installed, research suggested that it is unavailable in my region.

Methods tried includes:

1. *installing through 'extension + application' under the vm = onboarding failed, troubleshooting efforts did not yield success.*
2. *Installing through Monitoring - insights = unavailable.*
3. *Installing through "monitor" on portal - data collection rules - (the wizard was supposed to offer to install Azure Monitor Agent) = did not offer and was not in the list.*

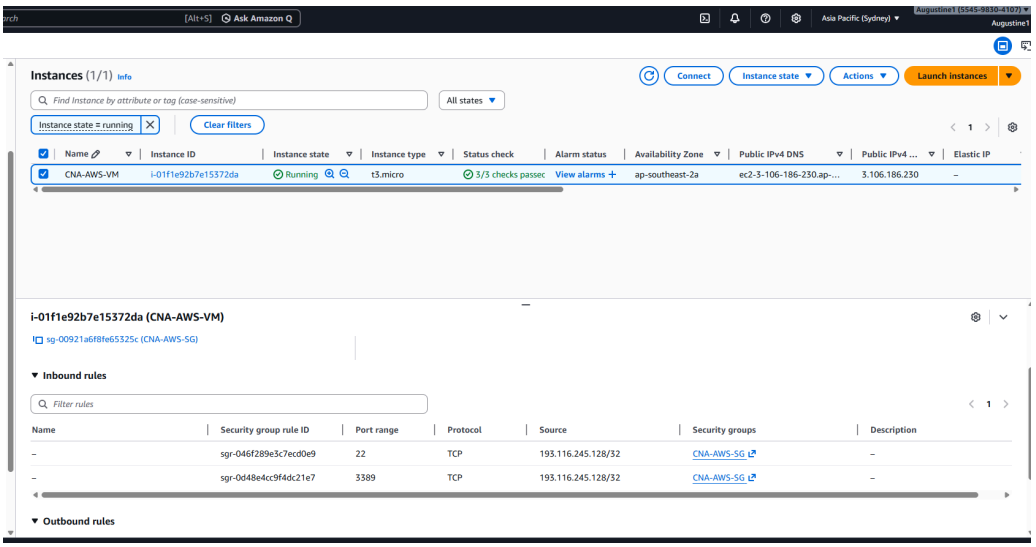
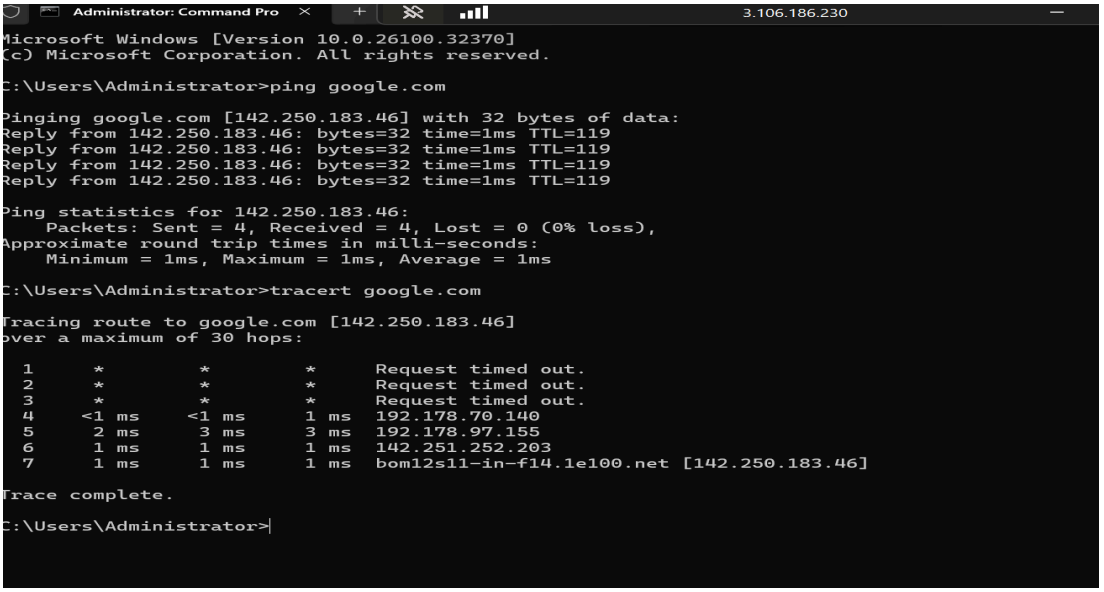
- Public IP

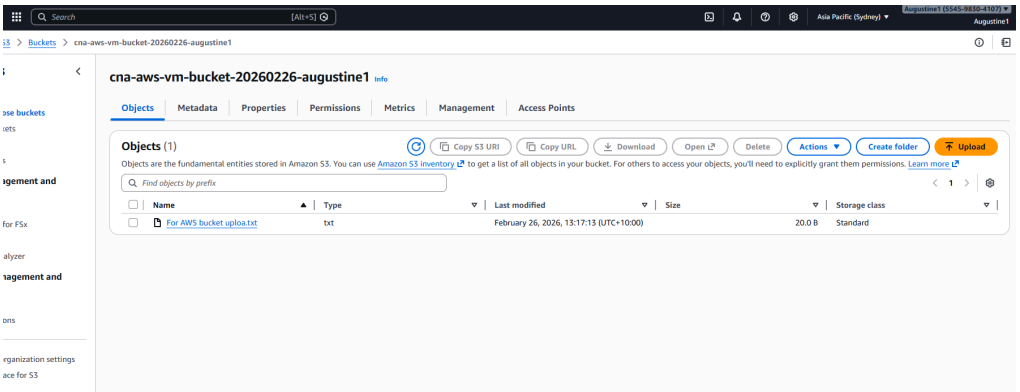
- Security Group inbound rules



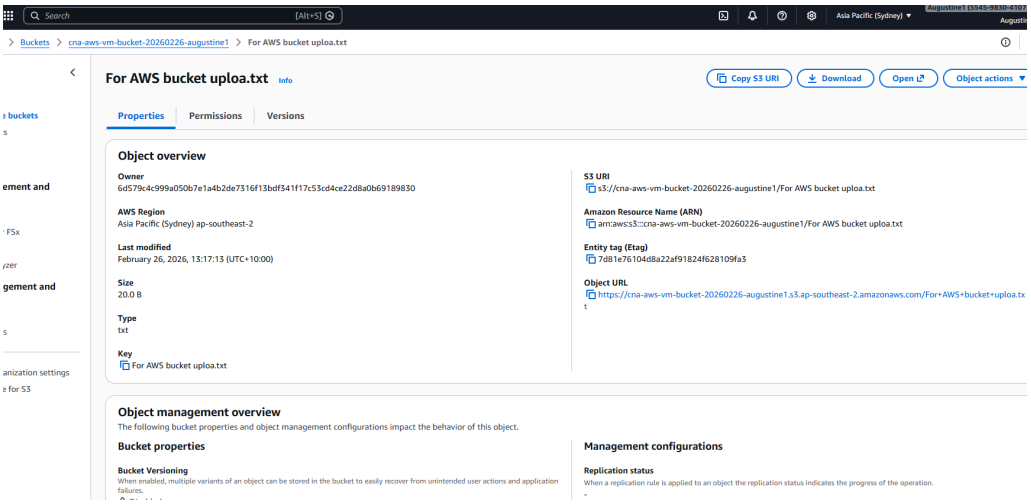
- Terminal output



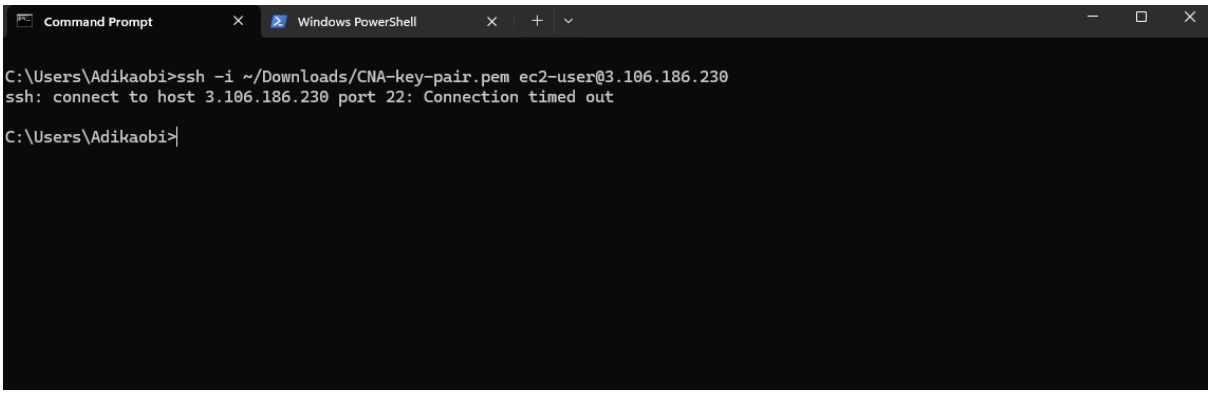
- S3 bucket overview



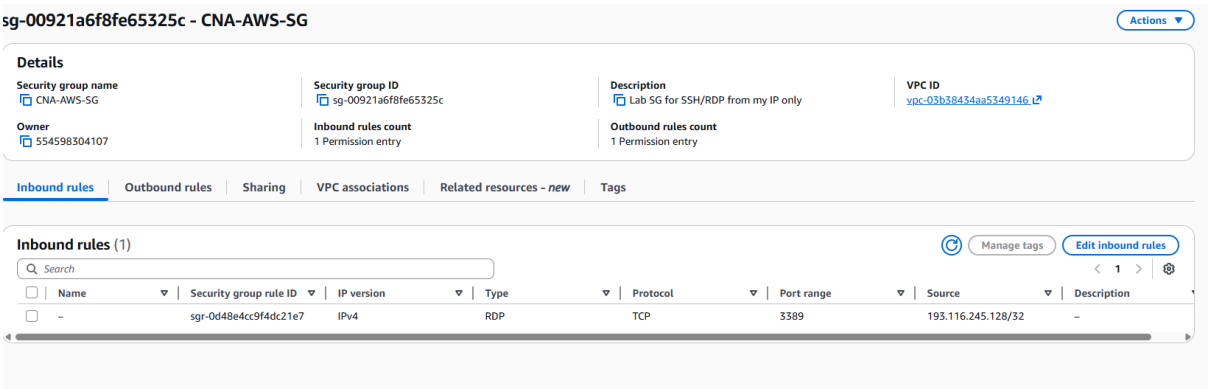
- Uploaded file



- Connection failure screenshot



- Updated Security Group rule



Assessment Review

Your assessment follows the technical requirements closely. Below are specific observations based on the tasks:

- **Security Best Practices:** You correctly restricted SSH and RDP access to your specific public IP for both Azure and AWS instances, which is a critical security requirement for defensive operations.
- **Azure Monitor Agent (AMA) Issue:** You noted that the AMA could not be installed due to regional unavailability and documented your troubleshooting steps, including trying via "extensions," "insights," and "data collection rules". This demonstrates professional documentation of technical roadblocks.
- **Honeypot Configuration:** You successfully configured the CNA-Honeypot with a public-facing web server on port 80 and SSH access on port 22, fulfilling the requirement for a visible entry point.
- **Network Restriction Test:** The assessment correctly demonstrates the impact of removing security rules to confirm that the firewall (Security Group) is functioning as intended.
- **Potential Improvement:** While the AMA might have been unavailable, for future projects or if the region supports it, ensure that the Log Analytics Workspace (LAW) is receiving heartbeat data from the VMs to verify that logging is fully operational beyond just the workspace creation
